## **PROJECT NARRATIVE**

The proposed BRANDON HYATT project is currently an agricultural parcel located south of S.R. 60 and east of I-75 in Section 20, Township 29 South, Range 20 East, in Hillsborough County. A location map is provided in the Supporting Material section. This Master Drainage Plan is for a stormwater management system with lake creation to serve a proposed Hotel/Restaurant commercial development. Stormwater runoff water quality treatment and attenuation will be provided in created ponds.

The majority of the project site is listed as Myakka fine sand (29), Basinger soils (5) and Malabar fine sand (27) by the Soil Conservation Service. These are identified from Hydrologic Group B/D to D type soils with the majority soil type of B/D.

Water quality treatment is provided by detention with effluent filtration prior to discharge into the wetlands adjacent to the site for ultimate discharge into Delaney Creek. Runoff analysis was performed using Advanced Interconnected Pond Routing (AdICPR). The stormwater management system for this project was designed to equal or exceed the requirements of the Southwest Florida Water Management District (SWFWMD) and Hillsborough County. Calculations supporting this design are included in this report.

### **SCS / NRCS SOILS IDENTIFICATION**

A map of the soils areas is provided in the Supporting Material section along with descriptive fact sheets for each of the soils included. As mentioned in the Project Narrative, the soils are identified as Hydrologic Group B/D to D type soils. Calculations in this report reference D type soils.

### **FEMA FLOOD INSURANCE RATE MAP**

According to the currently effective Flood Insurance Rate Map (FIRM 1201120380E dated August 15 1989) prepared by the Federal Emergency Management Agency (FEMA), the 100-year floodplain does not encroach upon the subject property. According to the preliminary Flood Insurance Rate Map (FIRM 12057C0380H dated September 28, 2007), the 100-year floodplain inundates the area shown as a pre-treatment sump adjacent to the subject property, yet also indicates the 100-year floodplain does not encroach upon the subject property. A copy of the applicable portions of the referenced FEMA FIRM Panels are included in the Supporting Material section.

### **100-YEAR FLOODPLAIN DETERMINATION**

The FIRM's specify the area as Flood Zones C or X, depending upon which map you

view (currently effective vs preliminary). Neither map supports a necessary 100-year floodplain elevation determination.

## **OFF-SITE DRAINAGE**

As stated in the project narrative, the project ultimately drains to Delaney Creek. The site is bounded to the north by SR 60, to the west by I-75 and to the east and south by the developments of Romano's Macaroni Grill and Brandon Town Center. No offsite areas drain through the project.

## **EXISTING CONDITIONS DRAINAGE ANALYSIS**

The project is less than 10 acres in size and therefore falls within the County Small Site Design Criteria which requires the maximum allowable discharge to be limited to the peak discharge based upon the 5-year FDOT Zone VI storm and the pre-developed condition. Additionally, the project is located in Delaney Creek and is identified to be contained within a peak sensitive design restricted area. Peak sensitive designs in Hillsborough County are recommended to utilize the 2.33-year storm and the pre-developed condition. Both criteria, however, allow for a capacity adjustment based upon a drainage capacity analysis of the flood-free capacity of the system.

A request was made of the Hillsborough County Planning and Growth Management Department (HCPGMD) which was forwarded to the Hillsborough County Public Works Department (HCPWD) for the location and design storm event for the critical restriction which resulted in the peak sensitive identification for the area. Dr. Junshan Su of HCPWD provided a reference to a previous request for the same information on a separate project as follows "The restriction peak water at 70th St. is 13.83 ft, NGVD, which is between 5 yr/24 hr and 10 yr/24 hr design storm event peak water levels. I would like to recommend you use 5 year existing conditions discharge, which is conservative." A copy of this e-mail is included in the Supporting Material Section.

Based upon this information the design was predicated upon the use of the 5-year storm and the pre-developed condition to limit the post-development 25-year discharge. As a significant storage and conveyance network does not exist on the proposed portion of the subject property to be developed, only surface runoff calculations have been performed for the existing condition.

The project area has been broken into four local drainage basins (100, 200, 300 and 400). The "Existing Basin Map" in the Supporting Material section shows the existing conditions drainage divides utilized for the stormwater modeling. Each of these local drainage basins was further subdivided to the respective portions which will be

included in the "project area" (subscript d). The remaining portions of the subject property which will continue to drain offsite as in the existing condition have not been included in the computations for allowable peak discharge.

Table 1 in Appendix D depicts the 5-year peak discharge rates from the project site. For detailed basin data sheets, input data, and hydrologic results please refer to Appendix D.

## **PROPOSED CONDITIONS DRAINAGE ANALYSIS**

In the proposed condition, the subscript d basins were revised to account for the proposed grading and the inclusion of three stormwater ponds. The "Proposed Basin Map" in the Supporting Material section shows the internal basin divides for the project site and the connectivity utilized.

There are three proposed ponds (Ponds A, B and C). Discharge from pond C is directed to the wetland immediately to the east of its location, while discharges from ponds A and B are to the wetland to the west of the project site.

Water quality treatment volumes shall be bled down in accordance with State water quality design standards, as required by the Southwest Florida Water Management District and Hillsborough County. The method utilized is effluent filtration (underdrain).

The site specific geotechnical report indicates SHGWT elevations are expected to be a one foot below the average existing grade, which indicates an elevation of approximately 29 NAVD 1988. This data conforms favorably to the average of the wetland SHW elevations noted for the eastern and western wetlands on the site. The site survey depicts a control structure with a top of 29.12 which provides a control for the eastern wetland. This value also conforms favorably to the predicted SHGWT, therefore an existing condition SHGWT of 29 is deemed acceptable.

In order to properly provide routing calculations for the proposed condition, a tailwater condition needed to be established at the wetland discharge points from the subject property. As the FIRM panels indicate, no 100-year floodplain inundation occurs on this property. The County stormwater model does not contain any nodes in the immediate vicinity of the subject property. The closest node to the discharge locations is Junction 217020 which corresponds to the stormwater pond for Brandon Town Center with a predicted 100-year flood stage of 30.07 NAVD 1988. Review of the topography collected in the general vicinity of the subject property indicate inundation of a significant amount of the commercial property to the south would begin at elevations around 31.1 NAVD 1988. Considering the development of the

project site was requiring a significant depth of fill, a conservative tailwater condition of 32.0 was imposed upon the property. This conservative tailwater condition still provides for a free-outfall condition from the designed ponds.

Table 1 in Appendix E depicts a comparison of the allowable 5-year peak discharges to the proposed 25-year peak discharges and provides the post 100-year peak stages in the proposed ponds.

For detailed basin data sheets, input data, hydrologic and hydraulic results please refer to Appendix E.

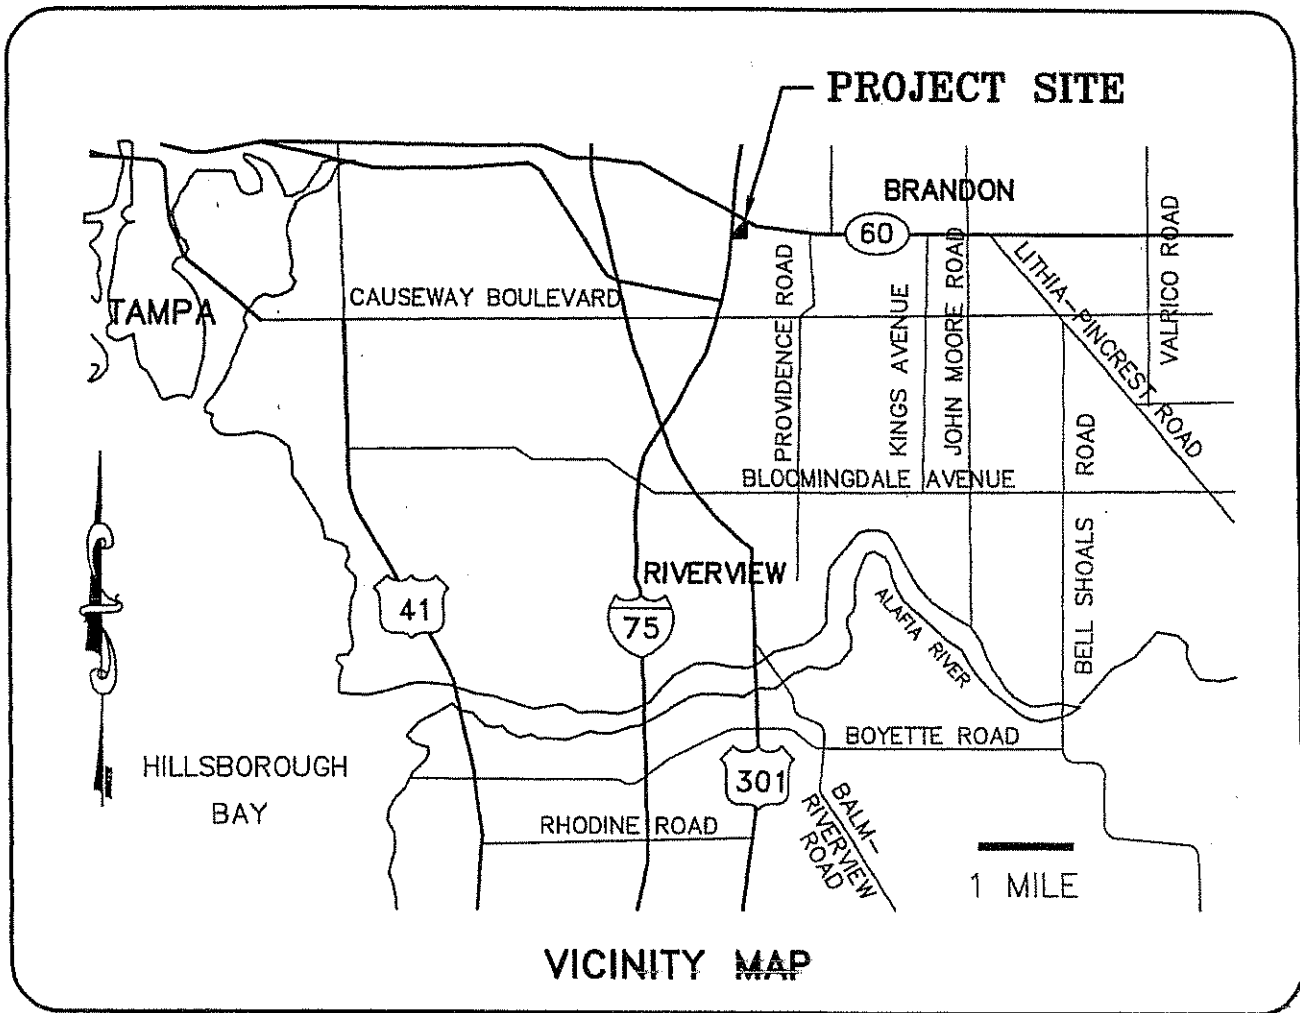

## **WATER QUALITY TREATMENT**

The water quality treatment on the project will be provided by utilizing effluent filtration (underdrain). Each treatment pods provides ½ inch of treatment for its respective contributing area.

Water quality treatment volumes will be bled down in accordance with State water quality design standards, as required by the Southwest Florida Water Management District. Underdrain sizing and treatment calculations are contained within Appendix C.

 Soils Map

Project No.: 5021-01 | Date: 03/27/08 | By: DLD  
 Section 20 Township 29 Range 20

5-Basinger, Holopaw and Samsula soils, depressional. The soils in the mpa unit are nearly level and very poorly drained. They are in swamps and depressions on the flatwoods. Generally, Basinger soils is along the exterior of swamps or in shallow depressions. Holopaw and Samsula soils are in the interior areas of the swamps or in deeper depressions. Undrained areas are frequently ponded for very long periods. The slope is 0 to 2 percent.

In 90 percent of the areas of this map unit, Basinger, Holopaw and Samsula soils, depressional, and similar soils make up 78 to 96 percent of the mapped areas, and dissimilar soils make up about 4 to 22 percent of the mapped areas. Generally, the mapped areas consists of about 35 percent Basinger soil and similar soils, 31 percent Holopaw soil and similar soils, and 18 percent Samsula soil and similar soils. The individual soils are generally in large enough areas to be mapped separately, but in considering their present and predicted use, they were mapped as one unit.

Typically, the surface layer of Basinger soil is black find sand about 7 inches thick. The subsurface layer, to a depth of about 28 inches, is gray fine sand. The subsoil, to the depth of about 42 inches, is brown and about 80 inches is light brownish gray fine sand. Similar soils included in mapping, in some areas, have surface layer of mucky fine sand, and it is more than 7 inches thick.

Typically, the surface layer of Holopaw soil is black mucky fine sand about 6 inches thick. The upper part of the subsurface layer, to a depth of about 12 inches, is dark gray fine sand. The middle part to a depth of about 42 inches, is light gray fine sand. The lower part, to a depth of about 52 inches, is grayish brown fine sand. The upper part of the subsoil, to a depth of about 64 inches, is grayish brown fine sand. The lower part to a depth of about 80 inches is gray, mottled sandy loam. Similar soils included in mapping, in some areas, have a black surface layer more than 10 inches thick.

Typically, the upper part of the surface tiers of Samsula soil is black much about 10 inches thick. The lower part, to a depth of about 34 inches, is dark reddish brown much. The layer below the organic material, to a depth of about 40 inches, is black fine sand. The underlying material to a depth of 80 inches is light brownish gray fine sand. Similar soils included in mapping, in some areas, have organic material that is more than 51 inches thick.

In most years, the undrained areas in this map unit are ponded for about 6 months. Permeability is rapid in Basinger and Samsula soils. It is rapid in the surface and subsurface layer of Holopaw soil and moderately slow or moderate in the subsoil. The available water capacity is low in Basinger soil, low or moderate in Holopaw soil, and high in Samsula soil.

In most areas, the soils making up this map unit have been left in natural vegetation. In some drained areas, the soils are used as pasture. In other areas that have been filled, the soils are used for homesite or urban development. The natural vegetation consists of cypress. The understory includes bluestem, maidencane, panicum, Jamaica sawgrass, and cutgrass.

The soils are generally not suited to most cultivated crops, citrus crops, or pasture because of ponding, excessive wetness, and low natural fertility. A drainage system in needed in most areas to remove excess surface water and reduce soil wetness, but suitable outlets are generally not available.

These soils are generally not suited to the production of pines because of ponding or extended wetness. They may be suited to the production of cypress and hardwoods through natural regeneration.

If these soils are used for building site development or for onsite waste disposal, ponding is the main limitation. Drainage is needed to lower the water table, and fill material is needed in most areas. While surface drainage helps to control ponding, the seasonal high water table is a continuing limitation.

The soils in the map unit are in capability subclass VIIw. Basinger and Holopaw soils are in woodland group 2W. Samsula soil has not been assigned to a woodland

Derek,

The restriction peak water at 70 Th St. is 13.83 ft, NGVD, which is between 5 yr/24 hr and 10 yr/24 hr design storm event peak water levels. I would like to recommend you use 5 year existing conditions discharge, which is conservative.

Please let me know if you have any questions.

Regards  
Junshan

Subject: Fwd: RE: Peak Sensitive Restriction Location Request

Dr. Su:

Mr. Doughty has requested the location of the restriction of the basin (Delaney Creek) down-stream from the below folios:

068101.0000 and # 068100.0000

Thanks in advance for your assistance.

Rick

Please provide a folio number to accompany your request.

Thanks, Rick

>>> "Derek Doughty" <derek.doughty@brooks-amaden.com> 03/05/2008 8:38 AM >>>

We have a current project on the Carey Farms property adjacent to Brandon Town Center in the Delaney Creek Watershed. I am requesting the County identify for me the location (specific Node) of the constriction which causes this area to be peak sensitive and the elevation of the concern so that a design storm can be computed.

Thanks

FEES SIMPLE DEED

THIS FEES SIMPLE DEED, made the 10th day of November, 1992, by WILLIAM O. CAREY and GERTRUDE E. CAREY, his wife (hereinafter called "Grantors"), to CAREY FARMS, a Florida general partnership (hereinafter called "Grantee"), whose post office address is 1602 Cottagewood Drive, Brandon, Florida 33510.

W I T N E S S E T H:

That the Grantors, for and in consideration of the sum of \$10.00 and other good and valuable consideration, the receipt of which is hereby acknowledged, do hereby grant, bargain, sell, and convey unto the Grantee and Grantee's successors and assigns, the following described land in Hillsborough County, Florida:

See Exhibit A attached hereto and incorporated by reference for the description of the land conveyed herein,

TOGETHER WITH THAT CERTAIN STATUTORY WAY OF NECESSITY DESCRIBED IN THE FINAL JUDGMENT RECORDED IN O.R. BOOK 4769, PAGE 1349, IN THE PUBLIC RECORDS OF HILLSBOROUGH COUNTY, FLORIDA.

THIS PROPERTY IS NOT THE HOMESTEAD OF GRANTORS.

TOGETHER with all the tenements, hereditaments, and appurtenances thereto.

TO HAVE AND TO HOLD the same unto Grantee and Grantee's successors, and assigns in fees simple forever.

This conveyance is made subject to applicable zoning ordinances, matters appearing on any recorded plat of the land, and taxes for the current year.

IN WITNESS WHEREOF, Grantors have hereunto executed this deed the day and year first above written.

Signed, sealed and delivered

FEE SIMPLE DEED

THIS FEE SIMPLE DEED, made the 10th day of November, 1992, by WILLIAM O. CAREY (as to a fifty percent (50%) undivided interest) and GERTRUDE E. CAREY, his wife (as to a fifty percent (50%) undivided interest) (hereinafter called "Grantors"), to CAREY FARMS, a Florida general partnership (hereinafter called "Grantees"), whose post office address is 1602 Cottagewood Drive, Brandon, Florida 33510.

W I T N E S S E T H:

That the Grantors, for and in consideration of the sum of \$10.00 and other good and valuable consideration, the receipt of which is hereby acknowledged, do hereby grant, bargain, sell, and convey unto the Grantee and Grantee's successors and assigns, the following described land in Hillsborough County, Florida:

See Exhibit A attached hereto and incorporated by reference for the description of the land conveyed herein.

TOGETHER WITH THAT CERTAIN STATUTORY WAY OF NECESSITY DESCRIBED IN THE FINAL JUDGMENT RECORDED IN O.R. BOOK 4769, PAGE 1349, IN THE PUBLIC RECORDS OF HILLSBOROUGH COUNTY, FLORIDA.

THIS PROPERTY IS NOT THE HOMESTEAD OF GRANTORS.

TOGETHER with all the tenements, hereditaments, and appurtenances thereto.

TO HAVE AND TO HOLD the same unto Grantee and Grantee's successors, and assigns in fee simple forever.

This conveyance is made subject to applicable zoning ordinances, matters appearing on any recorded plat of the land, and taxes for the current year.

IN WITNESS WHEREOF, Grantors have hereunto executed this deed the day and year first above written.

OFF 6932M177  
REC.

The East half of the West one-half of the East one-half of the East of the  
Section 20, Township 29 South, Range 20 East, lying south of  
Yale River Road and State Road No. 60, according to the Public Records  
of Hillsborough County, Florida, and the West 21.00 feet of the East  
21.00 feet of that part of the East of the East of Section 20 Township  
29, South Range 20 East, lying South of State Road No. 60, said  
from the point of intersection of the East boundary of the East of the  
East of the East of the East of Section 20 with the South right of way  
line of State Road No. 60, run North 45 degrees 45 minutes West along  
said South right of way line a distance of 200.0 feet; run thence  
South 25 degrees 14 minutes West a distance of 200.0 feet; run thence  
South 25 degrees 14 minutes East a distance of 200.0 feet; run thence  
North 25 degrees 14 minutes East a distance of 200.0 feet to the  
point of beginning this exception being more properly conveyed to  
Constance W. Lambert and Elizabeth W. Lambert as Maris 20, 1934,  
recorded in Book 1000, page 100, the South right of way line of  
State Road No. 60 in this exception being the line as existed on  
date of said deed to the Lamberts.

LESS AND EXCEPT THAT PART OF: ~

(1) The East 110.0 feet of that part of the SE 1/4 of the SE 1/4 of Section  
20, Township 29 South, Range 20 East, lying South of right of way of State  
Road 60,

(2) The West 1/2 of the East 1/2 of the SE 1/4 of the SE 1/4 of Section  
20, Township 29 South, Range 20 East, lying south of Yale River Road and  
State Road No. 60, according to the Public Records of Hillsborough County, Florida,  
and the West 21.00 feet of the East 21.00 feet of that part of the SE 1/4 of  
the SE 1/4 of Section 20, Township 29 South, Range 20 East lying South of  
State Road No. 60, from the point of intersection of the East boundary of the  
West 1/2 of the East 1/2 of the SE 1/4 of the SE 1/4 of Section 20 with the  
South right of way line of State Road No. 60, run North 25° 14' West along said South  
right of way line a distance of 200.0 feet; run thence South 25° 14' West  
a distance of 200.0 feet; run thence South 25° 14' East a distance of 200.0  
feet; run thence North 25° 14' East a distance of 200.0 feet to the point of  
beginning.

lying within the boundaries described as follows:

Begin on the South line of Section 20, Township 29 South, Range 20 East  
at a point North 87° 20' 11" East 110.0 feet from the Southeast corner  
of the Southeast 1/4 of the Southeast 1/4 thereof, said point being on  
a curve concave to the West and having a radius of 1,515.84 feet;  
thence from a bearing of North 02° 45' 21" East run westerly  
along said curve 711.49 feet through a central angle of 25° 31' 21" to  
the end of said curve thence North 02° 45' 21" West 23.97 feet to the  
beginning of a curve concave to the South and having a radius of  
408.00 feet; run thence 217.82 feet along said curve through a central  
angle of 15° 25' 10" to the end of said curve thence North 02° 45' 21" West  
628.83 feet; thence North 02° 45' 21" West 520.18 feet; thence North  
25° 23' 31" West 170.00 feet to the centerline of State Road 60; thence  
along said centerline South 02° 45' 21" East 522.50 feet; thence along  
said centerline run South 02° 45' 21" East 522.50 feet to a point at a  
curve concave to the South and having a radius of 135.00 feet;  
thence from a bearing of South 57° 34' 02" West run Southwesterly  
65.95 feet along said curve through a central angle of 15° 21' 12" to the  
end of said curve; thence South 41° 42' 21" West 227.66 feet; thence South  
37° 23' 50" West 260.37 feet to the beginning of a curve concave to the  
East and having a radius of 1,015.84 feet; thence along said curve  
151.11 feet through a central angle of 15° 25' 11" to the end of this  
portion of said curve, being a point on the South line of said Section 20;  
thence South 87° 20' 11" West 711.92 feet along said South line to the  
point of beginning.

## MEMO

**To:** File 5021-01 – Brandon Hyatt

**From:** Nicholas Messina *NM*

**Subject:** Pre-treatment pond impact calculations

**Date:** 4/15/08

**# Pages:** ~~X~~ 3

The proposed single lane access road onto the site from the east will fill a portion of an existing pre-treatment pond. The following details how the volume of impact and corresponding compensating volume were determined.

Impact volume- because the roadway profile decreases from east to west, the average end area method was used to determine the impact volume. Because the proposed road will be highest at the east end and side slopes have been held to a maximum of 4:1, the roadway cross section at this end represents the largest impact (201 SF). At the west end of the existing pond the impact cross sectional is reduced to 162 SF based on the lower road profile. The average of these two impact areas is 181.5 SF. When multiplied by the length of the impact (98 LF TOB to TOB), this results in an impact volume of 17,787 CF. Refer to CAD sketch for cross sectional areas

Compensating Volume – By widening the two pond sections to the west a compensating volume will be created. It is proposed to move the existing toe of slope approximately 40 FT to the west creating a 119 SF cross sectional area of cut /compensation. Refer to attached CAD sketch. Multiplying by the lengths of the two pond areas (174 FT total) equates to a compensation volume of 20,706 CF, which exceeds the impact volume.

- Soil Types from Table 15 "Soil And Water Features" in SCS Soil Survey
- Curve Numbers from Tables 2-2a, 2-2b, and/or 2-2c in SCS TR-55 Second Ed. (June 1986)
- Kinematic wave equation:  $T = 0.93((L^{0.6} * N^{0.6}) / (I^{0.4} * S^{0.3}))$
- Intensity computed using FDOT Regression Equation coefficients for:

$$I = A + B \ln X + C \ln X^2 + D \ln X^3$$

FDOT Zone: 6

25 - yr/24 - hr frequency storm

A = 16.15961

B = -3.48135

C = -0.0016

D = 0.02677

X is the time of concentration. Appropriate values for X are 8 to 180 minutes.

- Shallow Concentrated Flow based on TR-55 Fig. 3-1 for unpaved surfaces.  
 Curve defined in Appendix F as  $V = 16.1345 * S^{0.5}$

Project Name: Brandon Hyatt  
 Project Number: 5021-01  
 Subject: Proposed Basin Curve Numbers/Time of Concentrations

BY: DLD

Basin Name: DryEast Pond C  
 Basin ID: DryEast

Basin Area: 1.42 Acres

Curve Number:

Land Use Description	Soil Type	CN	Area (Acres)	Percentage (%)	% x CN
Open Space	D	80	0.08	5.63%	4.5
Impervious	D	98	1.19	83.80%	82.1
Pond	D	98	0.15	10.56%	10.4
Wetland	D	98	0.00	0.00%	0.0
			1.42	100.00%	
Weighted CN:					97.0

Time of Concentration:

A. Overland Flow Segment (kinematic wave eqn.)

L (feet)	N	S (ft/ft)	Travel I (in/hr)	Computed I
na	0.24	#VALUE!	20.9	#VALUE!

Computed Tc (minutes): #VALUE!

B. Shallow Concentrated Flow Segment

L (feet)	S (ft/ft)	V (fps)	Tc (minutes)
na	#VALUE!	#VALUE!	#VALUE!

C. Remaining Segment

L (feet)	V (fps)	Tc (minutes)
0	1.00	0.0

D. TOTAL Tc (minutes)

#VALUE!  
 Use 15 minutes

Notes:

- Soil Types from Table 15 "Soil And Water Features" in SCS Soil Survey

## APPENDIX F

**OPERATION AND MAINTENANCE GUIDELINES**

The work specified in this statement consists of the operation and maintenance activities required such as to insure adequate performance of the system and its continued safe operation.

The maintenance and operation entity should perform the following maintenance and operation procedures.

1. Discharge structures/control devices should be maintained operational by eliminating clogging of the baffles, grates, etc., caused by trash, debris and sediment. The inspection for proper operation and maintenance of these devices should be conducted quarterly. Additional monitoring and maintenance should be conducted after severe rainfall events.
2. Internal stormwater system inlets and manholes should be maintained operational by eliminating clogging of the slots, grates, interior pipes, etc. caused by sediment, vegetation and trash. The inspection for proper operation and maintenance of these devices should be conducted quarterly. Additional monitoring and maintenance should be conducted after severe rainfall events.
3. Detention areas should be maintained operational by removing sediments and trash which can hinder their function. The inspection of this area should be conducted quarterly. Additional monitoring and maintenance should be conducted after severe rainfall events.
4. Any eroded areas that are noticed during routine maintenance should be filled, as soon as discovered, with similar soils and grassed by sodding (staked) or seeding and having mulching (cut in) depending on the season.
5. Effluent filtration (man-made underdrains) systems should be maintained operational through the implementation of a periodic monitoring and maintenance program. The inspection for proper operation and maintenance of these systems should be conducted quarterly. Additional monitoring and maintenance should be conducted after severe rainfall events. The underdrains should be backflushed every two years. If the underdrain fails to drawdown the treatment volume in 36 hours after being backflushed, then the filter media should be removed and replaced in accordance with the approved plans and specifications. Spent filter material may be considered hazardous and should be disposed off-site at a facility capable of handling such material.
